MAR-MED INC. Mini Band Bone Saw is an easy way of cutting bone in the laboratory. Approximately the size of a microscope, the saw is only 18 inches high and only takes up 13" x 13" of counter space. The saw has a water cooled-blade that eliminates bone dust. Pieces of bone, up to three inches thick and of any length, can be cut quickly. The simple one-screw blade adjustment, provides a taunt blade that can make very thin slices of the bone. Holes in the table top allow water and bone residue to fall into the water reservoir. Constructed of plastic and aluminum material, the saw is light weight and can be cleaned quickly. Five types of blades are available. Three blades with teeth, cut the bone quickly and are safe to use compared to larger wood band saws. Two diamond blades, one standard and one with a heavier grit, are available. The diamond-coated blades have no teeth and will not cut the user's fingers. These blades cut small bones quickly. The 1/3 HP motor runs at 40 miles per hour. Clean up is quick and easy. The technician simply removes the blade cover, and the reservoir cover. Slight pressure on the motor removes the blade, the motor unit lifts off, and finally the reservoir is rinsed clean. Changing blades also takes less than 30 seconds.
